

Historical Evidence Review

A completed example of the monthly Evidence Desk format, using a verified non-customer historical/replay comparison. It is an illustration of research reporting—not a recommendation.

SAMPLE PERIOD	PREPARED	EVIDENCE MODE
23 September 2026	26 September 2026	HISTORICAL / REPLAY

Hard boundary

This sample examines a closed historical/replay record. It is not investment advice, a trade signal, a forecast, an income claim, or an instruction to buy, sell, or hold. No broker account, custody, order submission, or live trading was involved.

1. Research question

Within 30 isolated paired historical/replay portfolio tests on 23 September 2026, how did **Buy/Sell Split (All)** compare with **Total Net** on the recorded closed-result outcome and closed rotations?

2. Scope and controls

- 30 matched, browser-local historical/replay tests.
- Each test used a random 2–4 strategy portfolio drawn from the available 30-model candidate pool.
- The same basket was tested in both modes.
- Two batches: 10 tests, then 20 distinct additional tests.

3. What was excluded

- No live market feed, broker connection, order submission, or execution.
- No claim about future probability or performance.
- Partial 22 September collection excluded: it was stopped and is invalid for interpretation.
- No conclusion beyond this same-day sample.

4. Evidence extract

RECORDED MEASURE	BUY/SELL SPLIT (ALL)	TOTAL NET	BOUNDED READING
Higher closed-result outcome	21 of 30 matched tests	8 of 30 matched tests	1 test tied. This is a same-day historical observation, not a future rate.
Aggregate closed result	+\$5,800	-\$1,845	Aggregate within this sample only; it is not a return forecast or investable result.
Positive closed-result portfolios	23 / 30 (76.7%)	13 / 30 (43.3%)	Describes selected historical/replay portfolios under the tested setup.
Closed rotations	213	425	Split was less active in the recorded sample; this does not establish a general operational rule.

5. Finding, limited to the record reviewed

Bounded finding

In these 30 matched historical/replay tests, Buy/Sell Split (All) produced the higher recorded closed result more often than Total Net (21 versus 8, with 1 tie) and recorded fewer closed rotations (213 versus 425).

Support: The result appeared in both batches: 7 of 10 Split-higher in the first batch and 14 of 20 Split-higher in the additional batch.

Counter-evidence and limit: Eight tests favoured Total Net and one tied. The sample is limited to one historical day, a defined candidate pool, a local replay environment, and the tested mode settings.

6. Batch notes and audit trail

Batch 1 — 10 paired tests

- Split higher: 7
- Total higher: 2
- Tie: 1
- Aggregate closed: Split +\$2,435; Total -\$255
- Closed rotations: Split 47; Total 129

Batch 2 — 20 paired tests

- Split higher: 14
- Total higher: 6
- Tie: 0
- Aggregate closed: Split +\$3,365; Total -\$1,590
- Closed rotations: Split 166; Total 296

7. Replay and mode disclosure

HISTORICAL / REPLAY

The underlying test record came from isolated in-application historical/replay portfolios. The comparison is useful as auditable evidence of what occurred in that constrained record. It cannot show live execution quality, future market behaviour, availability of an instrument, real-world fills, slippage, or suitability for any person.

8. Limitations and counter-evidence

- Same-day evidence: this report does not claim the relationship persists across other days or conditions.
- Sampling: portfolios were random selections from the then-available 30-model candidate pool; they are not a representative universe of all possible strategies.
- Metric boundaries: aggregate closed result and rotation count are descriptive measures in the test record, not a complete risk assessment.
- Invalid evidence excluded: the partial 22 September collection was not used because it did not complete.
- No causal conclusion: the comparison does not establish why one mode was higher in the sample.

9. Conclusion

Answer to the sample question

For the defined 23 September 2026 historical/replay sample, Buy/Sell Split (All) had the higher recorded closed result in most matched tests and used fewer recorded closed rotations. That is the extent of the conclusion. It is not a forecast, a recommendation, or an execution instruction.

10. Audit appendix

Research format: sample monthly Evidence Desk delivery
Question type: historical/replay mode comparison
Evidence date: 2026-09-23
Paired tests: 30 (10 + 20)
Invalid material excluded: incomplete 2026-09-22 collection
Evidence record IDs: 20260923T135556837_hermes_a5207f60; 20260923T141109345_hermes_6596af9a;
20260923T141425749_hermes_31418092
Delivery status: public sample; non-customer data; no subscriber information included
